Education & Coursework

Quincy, MA

Eastern Nazarene College

Aug 2020 - May 2024

Major: Computer Science - B.S. (GPA: 3.67)

Programming Coursework: Algorithm & DataStructures, Databases, Operating Systems, Networks

Awards: Cum Laude

Projects

Virtual Memory Management System

- Developed an LRU page replacement algorithm, memory management logic, swap space management, and tracking the dirty bit.
- The system is able to handle page faults, write out modified pages back into memory, and read from virtual memory.
- Integrated file I/O for dynamic input, enhancing system flexibility and robustness.
- **Utilized:** C++, Memory Management, LRU Algorithm, File I/O

Address & Contact Book

- Using Java and JavaFX, I designed a reliable contact management system that implemented CRUD (Create, Read, Update, Delete) operations with effective data validation.
- Incorporated file I/O operations for data persistence in order to preserve contact details between sessions.
- To guarantee data integrity and improve user experience, input validation and error handling were implemented.
- **Utilized:** Java, JavaFX, FXML, File I/O

Restaurant Application

- Constructed two client applications for a client-server restaurant management prototype. While the kitchen client shows incoming orders and alerts the waiter when orders are ready, the waiter client enables staff to assign tables, take orders, and process payments.
- Using TCP/IP sockets, a multithreaded server was created to oversee real-time client communication in a restaurant system.
- XML-based communication and custom message types were used in the design of an asynchronous message handling system to guarantee dependable and organized data transfer between clients and servers.
- **Utilized:** C#, TCP/IP sockets, multithreading

Skills

Programming languages: C, C++, C#, Java, Python

Software: VSCODE, Git, Github

Databases: mySQL

Operating Systems: Windows, Linux
